

(a) SCHEMATIC — the KITE (Prop. 2.1), drawn at $2\alpha/\pi = 3/7$.
Two copies of T glued along BOTH legs = a bigon with one interior pole.

$O \sim O''$ — one corner of angle 2α
 A — one corner of angle $2(\pi/2 - \alpha) = \pi - 2\alpha$

R — the two right angles meet: cone angle π ,
 an interior SIMPLE POLE

the two free edges are the copies of H —
 the bigon's two sides, and what the necklace glues along

(b) SCHEMATIC — B is a cyclic chain of Q kites (Prop. 2.1).
 ι fixes one kite and the opposite H -edge, so D is a chain.

$D = B/\iota$ (shaded):
 the half-kite on the axis
 and $m = (Q-1)/2$ kites

the inner circle collapses to Z_O : Q corners of angle 2α , total $P\pi$
 the outer circle collapses to Z_A : Q corners of angle $\pi - 2\alpha$, total $(Q-P)\pi$
 $V = Q + 2$, $E = 3Q$, $F = 2Q$, $\chi = 2$ (drawn: $Q = 7$)
