

DATA — Remark 2.3: kite K_j has H -edges at $\{P + 2j, -P + 2j\}$, so a shared direction forces $j' = j \pm P$.
 The naive +1 reading agrees with the truth only at $P = 1$ and $P = Q - 1$.

(a) $P = 1, Q = 7$ — the gluing cycle is $\{7/1\}$.
 Here $j' = j + 1$ too, so the naive reading happens to agree.

(b) $P = 3, Q = 7$ — the gluing cycle is $\{7/3\}$.
 $j' = j + 1$ shares NO direction: the naive reading is wrong.

green t = geometric position, and position t holds K_{tP} · boxed number = the shared H -direction $P(2t + 1) \bmod 2Q$ · red arrow = the step out of K_0
