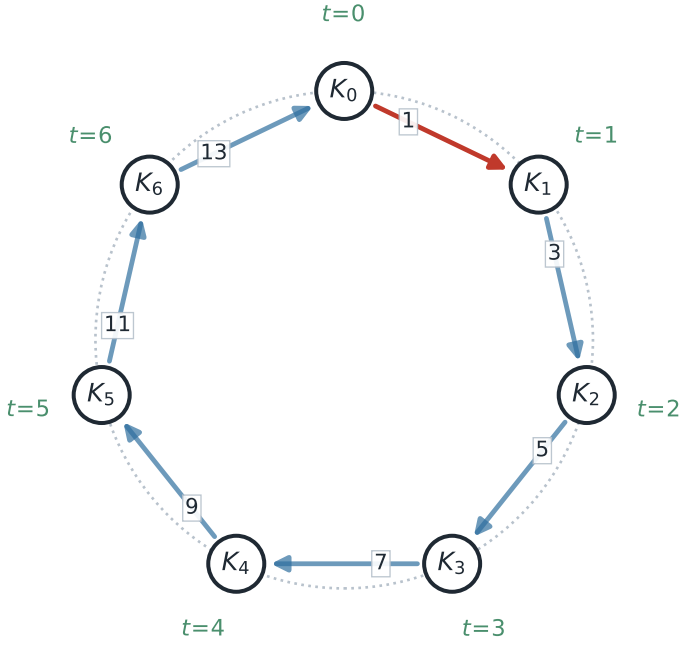
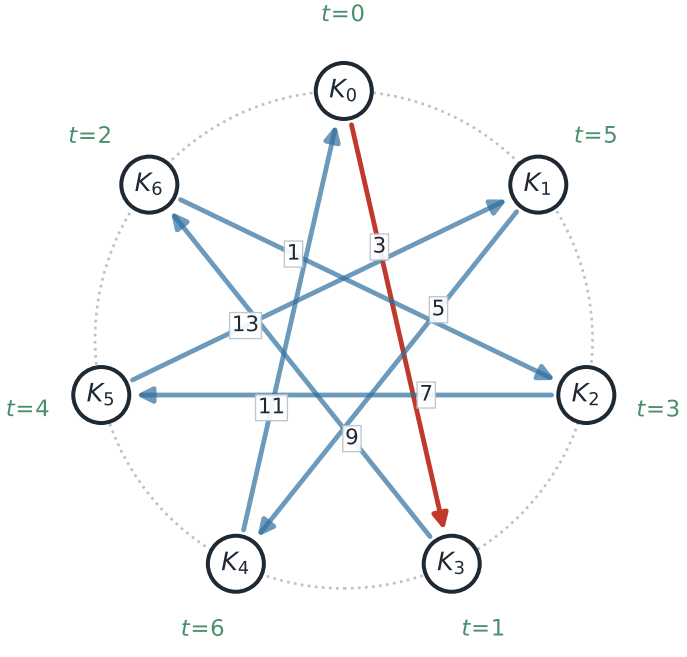
DATA — Proposition 2.2: kite K_j has H-edges at $\{P+2j,\ -P+2j\}$, so a shared direction forces $j' = j \pm P$.
The naive $+1$ reading agrees with the truth only at $P=1$ and $P=Q-1$.

(a) $P=1$, $Q=7$ — the gluing cycle is $\{7/1\}$.
Here $j'=j+1$ too, so the naive reading happens to agree.



(b) $P=3$, $Q=7$ — the gluing cycle is $\{7/3\}$.
$j'=j+1$ shares NO direction: the naive reading is wrong.



green t = geometric position, and position t holds K_{tP} · boxed number = the shared H-direction $P(2t+1) \bmod 2Q$ · red arrow = the step out of K_0
